

Proposed Specification Changes

Pending reconciliation of `spec:approved` items from `docs/notes_analyze.md` into `docs/Drydock_Specification.md`. 16 items.

#	Source	Change
A	FIX-1	Quality gate is blockers-only — spec still says "no open questions" for Ready; correct to blockers-only gating; both Questions and Ready permit <code>plan create</code> .
B	FIX-2	<code>spike-stack.json</code> example must be valid JSON — prompt showed unparseable options placeholder; spec should require valid JSON in all <code>spike-*.json</code> blocks.
C	FIX-3	SOUNDINGS precedence — use stated AC from sources where present; otherwise synthesize per feature/screen/persistence area. Remove "from spec files" wording.
D	FIX-4	"Do not invent gaps" clarification — fabricating requirements is forbidden; genuinely absent decisions (no auth model) are real gaps, not invented requirements.
E	FIX-5	<code>spike-stack</code> options = Rigging catalog filenames filtered to project type; <code>analyze</code> never opens per-technology stack files.
F	FIX-6	Checklist and project-type detection operate on imported source content only — no typed spec files exist at analyze time; remove <code>DATABASE.md/SCREEN-*.md</code> file-presence checks.
G	BUG-7	<code>blueprint/</code> must contain only <code>sources/</code> after import+analyze — typed-spec template stubs are <code>plan create</code> outputs, not import outputs; <code>METADATA.md</code> lives at target root, not <code>blueprint/</code> .
H	FIX-8	<code>analyze</code> prints artifact filenames it created — CLI output contract requires a list of written files on success.
I	FIX-9	Analyze prompt structured as ordered steps with per-step consumes/emits contracts — sequential pipeline: <code>sources</code> → <code>roles</code> → <code>blockers/questions</code> → <code>story list</code> → <code>SOUNDINGS</code> → <code>SEA_TRIALS</code> → <code>quality</code> → <code>questionnaires</code> .
J	FIX-10	<code>BLOCKERS.md</code> writer rejects empty/placeholder content — structural enforcement: ≥1 <code>##</code> heading required; absence of real blockers must not write/retain the file.
K	Feedback	Standing-directive methodology — each generative step exports a persistent feedback file (never overwritten by the command) re-injected at top of its prompt every run.
L	Feedback	<code>ANALYSIS_FEEDBACK.md</code> — target root, injection stack position 3 (after job block, before <code>BLOCKERS.md</code>); QuarterDeck shows it under ANALYSIS, editable, submit saves to file.
M	Feedback	<code>BUILD_CONFIGURATION.md</code> retired — no defined format, writer, or value; its two roles now split between feedback files (free-text) and answered <code>spike-*.json</code> (structured decisions).
N	Feedback	Rigging catalog = filename list only — inject <code>BRA*.md</code> + <code>stack/*.md</code> names, exclude <code>README.md</code> ; no file content injected; names are the spike-stack options source.

#	Source	Change
O	Feedback	Final injection stack — (1) prompt body (2) job block (3) <code>ANALYSIS_FEEDBACK.md</code> (4) <code>BLOCKERS.md</code> (5) Rigging catalog filenames (6) <code>blueprint/sources/*.md</code> ; COMPASS not injected.
P	Session	ANALYSIS.md tab structure — Overview/Story List/Open Questions/Notes; no <code>## Analysis Summary</code> heading; no <code>## Blockers</code> section; Open Questions items cite their <code>spike-*.json</code> file.
